Drumming for Fun, Wellness and Community

Thank you for purchasing our Shaw Percussion Adjustable Dundun Stand.
This document will show you how to assemble and adjust the stand for your drum and how to fit the parts together for easy transport. You can also view an online assembly instruction video at: http://bit.ly/DundunStandAssemble

Let's get started!

In the shipping box you will find four vertical legs with the L shaped drum supports attached with bolts and wingnuts, as well as two horizontal cross supports labeled as Upper and Lower. Also included (but not in picture above) is a carrying strap for transport.

First loosen and remove the two wingnuts and washers from one of the vertical legs.

Then separate the L shaped drum support from the vertical leg. You might need to use a mallet to loosen it, as the fit is purposely tight. Leave the bolts in the L shaped drum support.

Next place the vertical leg against your drum with the flat end facing up and the curved side facing away from drum. Adjust the height of the leg so the end facing up is at a comfortable playing height for your drum.

Then keeping the leg in the same position insert the L shaped drum support into the vertical leg with the L shape drum support resting on the head of your drum.

Next remove the wingnuts and washers and separate the L shaped support from the remaining three legs and match the position of the L shaped drum supports with the first one you just measured and assembled on your drum.

Now position the labeled Upper horizontal support and one of the vertical legs on your drum. Estimate the position of the vertical leg along the horizontal support and loosely fasten with the washers and wingnuts. You will be fine tuning the fit when the second leg is attached.

Then attach the second leg on the other side of the horizontal support with the L shaped drum support facing towards the drum head. Make sure the bolts are resting in the slots on the horizontal support. Adjust both vertical legs on the horizontal support so it is centered and the fit on the drum is snug. There should be a small gap between the horizontal support and the drum head, with the L shaped drum supports resting on the edge of the drum head. When you are happy with the fit, tighten all the wingnuts.

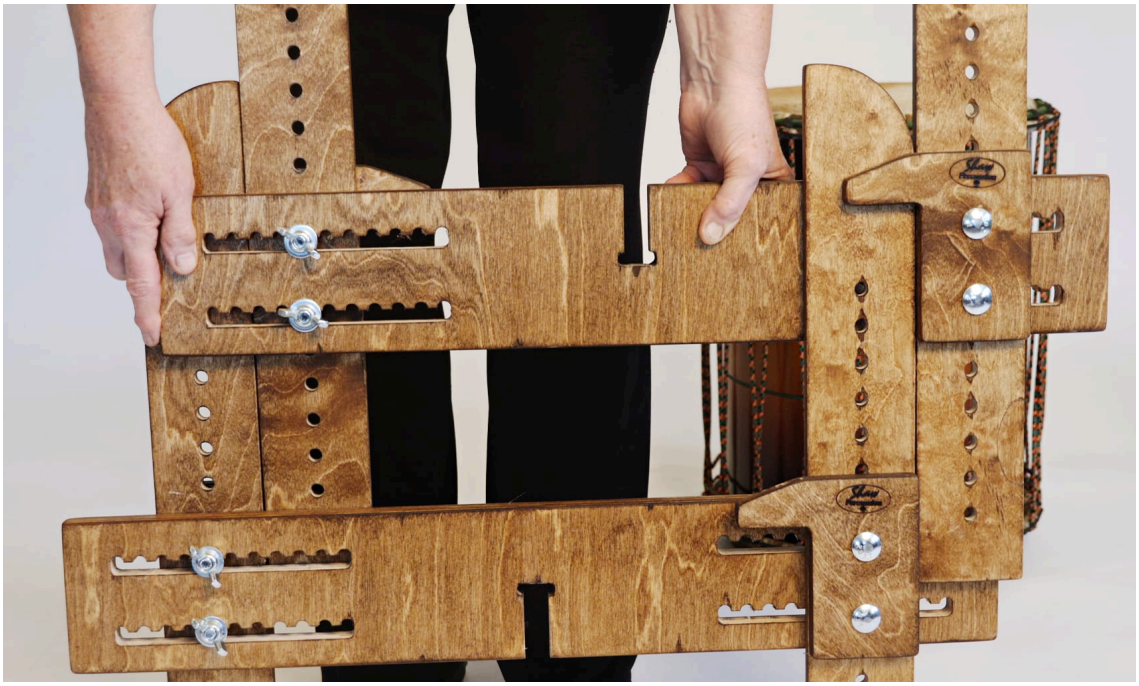

Then using the completed upper stand part as a guide, assemble the lower one.

Next, join the two assembled parts using the center notches, insert the upper part into the lower one.

Then place your drum into the stand and check again that the drumhead is resting on the four L shaped drum supports and that there is a small gap between the bottom head and the horizontal supports. Make any final adjustments if necessary and tighten all the wingnuts.

The two Shaw Percussion Dundun Stand upper & lower parts are designed to fit together for transport. At first It can look like a bit of a puzzle, but if you examine the picture above and practice a few times, fitting the parts together will be easy.

Finally, loop the carry strap around the ends for transport .

Congratulations on assembling your Shaw Percussion Adjustable Dundun stand!

If you have any questions, please contact us at info@shawpercussion.com

Enjoy your stand!
